TSUBAKI KABELSCHLEPP | The company

Over 60 years of innovations and thousands of realized applications

In 1953, the Waldrich Maschinenfabrik registered a global patent for a steel "unsupported cable carrier to protect moving cables and hoses". The visionary company owner Dr. Oskar Waldrich recognized the invention's potential and established his own subsidiary for the new product in 1954: KABELSCHLEPP. Since this launch, the company has been ensuring the continuous further development of the applications involving this machine and system component — constantly with new product concepts, innovative materials and extensive customer service.

TSUBAKI KABELSCHLEPP is currently a global player with international representatives and subsidiaries in more than 70 countries and cable carrier systems are a permanent component of almost every machine. Our innovative solutions have proven themselves worldwide in the most diverse industries — and in fact, no longer just in the classical application areas such as machine tools, crane systems, washing lines and medical and laboratory technology, but also in industrial robots, high-sea oil drilling platforms and space travel. Our experts

develop individual products even for complex and unusual fields of usage. In this process, the application defines the material — in addition to steel cable carriers, plastic and hybrid systems are also available. This allows for a wide range of products which can be used for countless applications. There is even an ideal solution for individual challenges — in standard widths or adapted to customer requirements on a millimeter grid. The range of products and accessories comprises over 100,000 variants. These include, for example, strain reliefs, divider systems, channels, hoses, cables, connectors and ready-to-install complete systems.

TSUBAKI KABELSCHLEPP | The company

KABELSCHLEPP and TSUBAKI – together what fits together

TSUBAKI KABELSCHLEPP is integrated into the TSUBAKI Group since 2010 and made responsible for managing the worldwide Cable Carrier Systems business. For more than 40 years, both companies have been close cooperative partners. With this integration, we will leverage our successful working relationship in one strategic enterprise.

This global enterprise offers numerous advantages:

- An even larger product portfolio to select from
- Global yet locally supported vast network of more than 40 international subsidiaries
- Global manufacturing operations allow for shorter delivery times
- Combined R&D resources allow for quick and innovative product development

KABFI SCHI FPP + TSUBAKI = MORF

MORE Product Solutions

An expanded product portfolio of TSUBAKI products and KABELSCHLEPP cable carrier systems.

MORE Innovations

A combined global R&D with even more resources ensures a quicker response to our customer's needs.

MORE Regional Service

A combined TSUBAKI and KABELSCHLEPP sales force provides added local support.

KABELSCHLEPP® products are also now available through the TSUBAKI network of distributors.

MORE Global Support

A unified global sales and support network extends to over 70 countries around the world, providing service and support when and where you need it most.

MORE Value

Together we will continue to prove our reputation as one of the industry's "Best Value" supplier in the industry.

TRAXLINE® | Overview

TRAXLINE® cables for cable carriers

TSUBAKI KABELSCHLEPP — inventor of the cable carrier. The product portfolio comprises over 100,000 steel, plastic variants and hybrid systems. Always a suitable, reliable cable carrier, whether standard or individual complete solution. We are active for you worldwide. We use our more than 60 years of experience to continuously develop the "driving force" — the TRAXLINE® cables — and adapt them to the requirements of the market.

Our cable series meet the highest quality standards to ensure the availability of your systems.

Our TRAXLINE® cables are continuous bending hi-flex and very durable. Tested functional reliability which meets applicable standards and guidelines is an essential criterion.

Competent, target-oriented system consultation and global on-site service are our constant commitment to the technical and economical optimization of your applications.

Product range

The TRAXLINE® range is continuously being optimized and expanded, especially for the ever increasing requirements of use in cable carriers. A clearly structured type selection provides a unique combination of performance characteristics and usage possibilities.

- Highest quality requirements
- Continuous bending hi-flex, very durable
- Complies with applicable standards and guidelines
- 2D applications (unsupported and gliding)
- For all environments from cleanroom applications to tough ambient conditions in a rough operating environment

Service & Support

- Competent, target-oriented system consultation and global on-site service
- Fast availability through stockkeeping of more than 500 cable types

Special designs for projects

TSUBAKI KABELSCHLEPP cable warehouse

Over 500 cable types, constantly available from the warehouse, ensure fast availability around the globe. We deliver from stock.

TRAXLINE® Infocenter

With the aid of the TRAXLINE® info center, you can find the right cable for your cable carrier system with just a few mouse clicks. Simply enter the parameters for your application at **traxline.de** and find the ideal cable for your requirements.

TRAXLINE.de

TRAXLINE® | Design engineering

Efficient design engineeringPrecise and fast

Decrease your engineering times, accelerate your design processes, configure with original data directly from the manufacturer.

We are continuously investing in providing product-related data online to make your work easier. This allows you to access current product and CAD data already during the design engineering phase.

We are currently offering comprehensive technical information materials in three online tools which are partially interlinked.

Our web-based OnlineEngineer platform with worldwide online access provides a variety of functions to support you with the selection and configuration of products for your application. All necessary technical and calculation information for the individual products from the areas of cable carriers, cables and other accessories are provided on a central, clearly structured platform. Selection of the suitable products is made substantially easier by entering different parameters.

For even more efficient use, the data portals of OnlineEngineer and CADENAS are linked. This allows you to quickly and easily download the suitable CAD model for your product configuration without having to exit OnlineEngineer.

CADENAS 3D CAD catalog

CADENAS is an internationally used platform for providing 3D component models in a variety of CAD formats. It includes a large number of renowned companies from mechanical engineering, plant engineering and other industry sectors. We are currently offering CAD models in all standard CAD formats for the entire product portfolio. The database also contains the corresponding models for guide channels and support trays. The catalog is continuously expanded and supplemented.

TOTALTRAX® | Overview

System competence

TOTALTRAX® complete systems

As a specialist for cable carriers and drag chain cables of all kinds, we have been a reliable partner for many decades also when it comes to turnkey complete systems.

Thousands of systems implemented by us are in use worldwide, each individually adapted to the customer application. Whether single harnessed cable carrier or highly complex system — we offer ready-to-install assemblies for almost any area of application.

As a member of the TSUBAKI group, we are part of a globally operating group of companies. This allows us to offer our customers and partners the international presence of a global player combined with the flexibility and creativity of a medium-size enterprise.

The following applies to all systems:

- Manufactured from high-quality components
- Perfectly adapted components
- Optimized turnaround times
- "Just-in-time" deliveries
- Complete systems from simple to complex

We take care of everything – and you can relax

Our system experts work with you to develop the technical solution as a reliable assembly for your product.

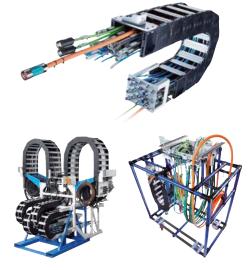

This also includes the correct selection of the individual parts and the procurement of purchase parts: smooth interaction

of all components is essential for a permanently functioning system.

The result: a customized pasrt list based complete system consisting of up to several hundred individual components.

We support you with:

- Extensive consulting during planning
- Support for project planning
- Preparation of an individual cable plan
- Engineering for precision-fit interfaces
- Customized system as per customer requirements
- Procurement of all components
- Professional support during the entire project
- Only one contact continuously from the first project planning meetings until installation
- Aftersales partnership

Our complete systems - delivered assembled and ready

Optimized manufacturing processes and coordinated provision of the correct components guarantee fast turnaround times and save you time and money, no matter how simple or complex your system is.

For large batches we can set up customer-specific production lines on request. We configure and manufacture economically viable individual solutions from a batch size of just one.

High-quality individual components make our complete systems reliable, resistant and durable. Regular checks

additionally ensure consistently high quality. We even confirm this in writing:

for individual components and

for ready-mounted assemblies – on request with certificate and comprehensive project documentation

We deliver the cable carrier "just in time" and ready for installation, to your production facility or to the desired installation site. Safely transported in single-use or returnable packaging, if required in an optimized transport frame.

Difficult installation situation?
Our service team can take on the installation or support your with their expertise.

The optimized process:

Standardized manufacturing processes

Use of high-quality components

Customized production line on request

Permanent quality control during production and assembly

Complete installation by our service team

Your benefits at a glance

Obtain your complete system from one source: that makes procurement easier while also saving time and money.

- Complete delivery from one responsibility
- One contact for the complete system
- No storage costs

- Reduced procurement costs by concentrating on one partner
- Reduced effort for goods incoming inspections
- Timely delivery directly to your production facility
- Shorter downtimes through plug & play installation

Subject to change.

TRAXLINE® Cables for Motion

More Information:

TRAXLINE® | Cable carrier cable range

Reliable – Robust – With high availability

TRAXLINE® cables for cable carriers: Reliable, robust with high availability. Your benefit from many years of experience combined with ongoing optimization, proven in tests

and applications. TRAXLINE® cables stand for competent system-supply with worldwide on-site service.

Our Series are available in different qualities:

- 200/200C: Layer stranded cables with PVC outer jacket for light to medium demands
- 400/400C: Bundle stranded cables with PVC outer jacket for medium heavy demands
- 700/700C: Bundle stranded cables with PUR outer jacket for heavy demands
- 1000/1000C: Bundle stranded cables with TPE outer jacket for really heavy loads

Control cables

Hi-flex Control cables for use in cable carriers

- Communication between transmitter and receiver
- Signal for turning on and off/start and stop

Power cables

Hi-flex Power cables for use in cable carriers

- Power supply of electrical applications and electric drives
- Transmission of large electrical currents

High voltage cables

Hi-flex High Voltage Power cables for use in cable carriers

- High Voltage power supply of heavy duty applications and drives
- High current flow
- Single core

BUS cables

Hi-flex BUS cables for use in cable carriers

- Network
- Communication with several participants

Coaxial cables

Hi-flex Coax cables for use in cable carriers

Transmission of video and audio signals

Data cables

Hi-flex Data cables for use in cable carriers

- Network
- Communication between transmitter and receiver
- Transmission of information

Fiber optic cables

Hi-flex Fiber optic cables for use in cable carriers

- EMC-save data Transmission
- very high data rate with speed of light
- metalfree

OEM cables

Hi-flex Servo & Feedback cables for use in cable carriers

- Supply and control of servo drives
- OEM quality

Assembled cables

You need connection-ready harnessed bus cables?

Or harnessed signal- or power cables for drives — in accordance to OEM specifications?

Subject to change.

TRAXLINE® CONTROL 200

Unshielded continuous bending hi-flex PVC control cables

from page 164

Fechnical Information from page 178

Fon: +49 (0)2762 4003-0 Technical support:

Up to 2 Million Motion cycles

General information

- Communication between transmitter and receiver
- Logical state of 0 and 1 control
- Signal for turning on and off/start and stop
- Outer jacket valley-sealed extruded and high abrasion resistant

Norms and standards

- Oil-resistant
- UV-resistant
- CFC-free ■ REACH/RoHS II
- Ozone-resistant Silicone-free
- Flame-retardant

Design

Conductor:	Class 5
Core insulation:	PP/9Y
Core identification:	Black, coded with white numbers, 1 x ye/gn
Core stranding:	Conductor cores layered
Shield:	Unshielded
Jacket color:	Black
Outer jacket:	PVC
• • • • • • • • • • • • • • • • • • • •	····•··········

Technical data

Temperature range while moved:	-5 up to +80 °C (-5 up to +80 °C UL)
Minimum bend radius while moved:	KR _{min} ≥ 10 x Ø
V _{max} supported:	3.5 m/s
V _{max} gliding:	2 m/s
a _{max} supported:	10 m/s ²
a _{max} gliding:	10 m/s ²
Insulation resistance:	> 30 MΩ x km
Nominal voltage control core(s):	according to VDE 0.30/0.50 kV according to UL 0.30 kV

- Flame-retardant
- NEK 606
- Halogen-free

Design

Conductor:	Class 6
Core insulation:	PP/9Y
Core identification:	Black, coded with white numbers, 1 x ye/gn
Core stranding:	Bundle stranded (> 8 cores) Layer stranded (≤ 8 cores)
Inner jacket:	TPE
Shield:	Shielded
Jacket color:	Black
Outer jacket:	PUR

Technical data

Temperature range while moved:	-35 up to +90 °C (-35 up to +80 °C UL)
Minimum bend radius while moved:	KR _{min} ≥ 7.5 x Ø
V _{max} supported:	20 m/s
V _{max} gliding:	5 m/s
a _{max} supported:	50 m/s ²
a _{max} gliding:	50 m/s ²
Insulation resistance:	> 30 MΩ x km
Nominal voltage control core(s):	according to VDE 0.30/0.50 kV according to UL 0.60 kV

TRAXLINE® POWER ONE HEAVY DUTY 6/10 KV

Shielded continuous bending hi-flex PUR high performance cables

Definition rom page 164

Fechnical Information from page 178

Technical support: Fon: +49 (0)2762 4003-0

General information

- Power supply for big electrical applications and drives
- Good EMC-protection by overall-shield
- For small bending radii and very long travel distance
- Side pressure strength, tear propagation strength and cut resistant
- Outer jacket pressure extruded and high abrasion resistant

Norms and standards

- Oil-resistant
- UV-resistant
- Ozone-resistant
- Silicone-free
- CFC-free

- REACH/RoHS II
- Flame-retardant
- NEK 606
- Halogen-free

Design

Conductor:	Class 6
Core insulation:	EPR
Core identification:	Black
Core stranding:	Wire bundles
Inner jacket:	TPE
Shield:	Shielded

TRAXLINE® DATA 700 TPI CD 1 KV

Double-shielded continuous bending hi-flex PUR data cables

Up to 7 Million Motion cycles

General information

- Communication between transmitter and receiver
- Transmission of information
- Very good EMC-protection by Overall-shield and pair
- Pair twisted cores reducing common mode intefereces
- Outer jacket pressure extruded and high abrasion
- Inner jacket valley-sealed extruded

Norms and standards

- Oil-resistant
- UV-resistant
- Ozone-resistant
- Silicone-free
- CFC-free

- REACH/RoHS II
- Flame-retardant
- NEK 606
- Halogen-free

Design

Conductor:	Class 6
Core insulation:	PP/9Y
Core identification:	Black, coded with white numbers
Core stranding:	Cores pair twisted in short pitches with minimal torsion
Inner jacket:	TPE
Shield:	Double shielded
Jacket color:	Black
Outer jacket:	PUR

Technical data

Temperature range while moved:	-35 up to +90 °C (-35 up to +80 °C UL)
Minimum bend radius while moved:	KR _{min} ≥ 7.5 x Ø
V _{max} supported:	20 m/s
V _{max} gliding:	5 m/s
a _{max} supported:	50 m/s ²
a _{max} gliding:	50 m/s ²
Insulation resistance:	> 30 MΩ x km
Nominal voltage power core(s):	according to VDE 0.60/1.0 kV according to UL 1.00 kV

Assembled OEM high flex cables

Assembled cables | Overview

You need connection-ready harnessed bus cables? Or harnessed signal- or power cables for drives - in accordance to OEM specifications?

Simply order by quoting just the OEM order number and cable length, and wait for your checked top quality goods to arrive.

Connection-ready harnessed cables

- easy to order with just order number and cable length
- in accordance to OEM specifications
- Just-in-time delivery of three work days
- checked and monitored for reliable connection

Properties of the cables used:

Power cables according to SIEMENS

Extension cables

In addition to connection-ready harnessed basic cables, extension cables are also available. These are available as signal and power cables for drives — according to OEM specifications.

Simply order by quoting just the **order number and cable length**, and wait for your original quality goods to arrive.

Signal cables assembled to BOSCH REXROTH

Shielded continuous bending hi-flex cables

Properties of the cables:

- UV-resistant
- Halogen-free ■ Flame-retardant
- Approvals: cURus, based on VDE,

REACH/RoHS II

c¶°us (€

■ CFC-free Minimum bend radius 7.5 x Ø to 10 x Ø

Cable engineering | Design elements

02 Design elements

2.1 Core and conductor

- Metric construction: Core-number x Cross-section in mm², e.g. 6x0.25 mm².
- AWG (American Wire Gauge) construction: Core-number x Cross-section in AWG e.g. 4xAWG22.
- Finest copper wires of class 5 or class 6 with highest requirements of cleanliness.
- The bigger the cross-section the higher may be the current flowing at the same voltage

Copper wire dimensions: AWG vs. metric

AWG-No.	Cross section [mm²]	Diameter [mm]	AWG-No.	Cross section [mm²]	Diameter [mm]	AWG-No.	Cross section [mm²]	Diameter [mm]
500	254	20.7	8	8.366	3.26	24	0.205	0.511

7	10.6	3.67	23	0.259	0.573	39	0.00632	0.0897

2.2 Core insulation

- Is covering like a skinning tube the copper core to make sure from core to core copper contact to avoid with any short circuit.
- Electrical insulation is defining the voltage level depending on material and wall thickness.
- Isolation material will be coated as per pressure extrusion around the core.
- Potential earth: construction identification contains a "G", 2 colored yellow/green core insulation for "PE" potential earth.
- Mechanical stiffness for the copper core will be provided.

Cable engineering | Design elements

2.3 Core-marking

- Core marking as per numbers referring the numbers of the cores inside this cable for easy conducting at the clamp box or assembling at the plug end.
- Additional earth conductor, marked green/yellow without numbering.
- Cores of data cables are color coded using the defined color code as per DIN 47100 – in practice under worldwide using.
- For special constructions are different color codes are possible (Siemens, Indramat ...).

DIN 47100 color code

1 white	11 grey-pink	21 white-blue	31 green-blue	41 grey-black
2 brown	12 red-blue	22 brown-blue	32 yellow-blue	42 pink-black
3 green	13 white-green	23 white-red	33 green-red	43 blue-black
4 yellow	14 brown-green	24 brown-red	34 yellow-red	44 red-black
5 grey	15 white-yellow	25 white-black	35 green-black	
6 pink	16 yellow-brau	26 brown-black	36 yellow-black	
7 blue	17 white-grey	27 grey-green	37 grey-blue	
8 red	18 grey-brown	28 yellow-grey	38 pink-blue	
9 black	19 white-pink	29 pink-green	39 grey-red	
10 Violet	20 pink-brown	30 yellow-pink	40 pink-red	

The first colour describes the base colour of the core insulation, the second colour that of the printed ring.

2.4 Center element

- Cavities are filled delivering more stability of the complete cable.
- The center element holds the stranding safe in its position and is built like a fibrous rope.

2.5 Stranding of cores

Characteristics to differ the stranding

Layer stranding: The cores of the cable are stranded concentric positioned into the direction of the length axle — all around the center element in the middle of the cross section. High load resistance, good working inside cable carrier applications.

Bundle stranding: Several cores are bundled and in addition these bundles are bundled again together into the direction of the length axis Therefore useful for very high load and /or long travel applications in optional very high speed ranges.

Twisted Pair stranding: Cores get twisted as pairs together, then they get twisted with several other pairs into direction of the length axis or around the center element. This stranding will avoid cross talking (negative influences of parallel cores). Useful under high mechanical load inside cable carriers.

Hybrid stranding: Power cores and data cores in one cable, optional with BUS cores. Additional construction elements are marked with a "+" in the construction identification.

Cable engineering | Design elements

2.6 Inner jacket

- Stabilizing the stranding bandage, increasing the mechanical strength increasing the bending strength.
- Coated as per pressure extrusion.

2.7 Shielding

- Shielding made of Cu-braid or a foil of aluminum or a combination of both to improve electromagnetic compatibility (EMC).
 - Active shield: To avoid the stepping out of magnetic stray fields out of power cables.
 - Passive shield: To avoid the penetration/intrusion of magnetic stray fields into data transferring cables
- Single shield around all stranded cores is marked by a "C" in the name of the cable series, with brackets in the construction identification.
 - E.g. POWER 700 C (4G6 mm²) Cu- braid around all stranded cores.

- Double shield is marked by a "CD" in the name of the cable series, with doubled brackets in the construction identification.
 - E.g. ((4x2xAWG 26)) Cu-braid and aluminum foil shielding around all stranded cores with very high EMC safety.
 - E.g. (3x(2x0.25²)) Cu-braid around all stranded cores and all pairs with very high EMC safety.

2.8 Outer jacket

- Safety skin around inner construction against external mechanical, thermic and chemical influences as well as ultra violet radiation as well as atomic radiation in seldom cases.
- Provides stability jacketing to strengthen the complete undercover construction elements.
- Design elements covered as per pressure extruded sheath.

169

3.1 Oil-resistant

The term describes the chemical resistance of cables against an oil or lubricant containing environment. The resistance is very important for penetrating substances into the outer jacket which may cause earlier defect. Please take care of the valid standards which are mentioned in the datasheet of every cable.

3.2 UV-resistant

This term describes the resistance of the outer jacket against early aging by ultra violet radiation of sunlight. UVresistance of colored cables may be reduced after long time. Our cables are weatherproof, too. (Outdoor - direct, Indoor – indirect). Please take care of the valid standards which are mentioned in the datasheet of every cable.

3.3 Ozone-resistant

Near to neon lamps between the cable and air builds ozone. This can cause ozone clefts, if the parts are under load or movement.

3.4 Petroleum-resistant

Our PUR cables are NEK 606 certified. Please take care of the valid standards which are mentioned in the datasheet of every cable.

3.5 Halogen-free

Halogen-free cables do not contain substances such as chlorine, fluorine, iodine or bromide. In case of fire these substances form with the extinguishing water a hydrochloric acid which affects large parts of the equipment. The smoke contains nitrous toxic gases which causes cancer. Please take care of the valid standards which are mentioned in the datasheet of every cable.

3.6 CFC-free | Chlorofluorocarbons

Due to the very detrimental effects of CFC on the environment, and in particular on the ozone layer, we do not use them neither in the in the production process nor in the products themselves.

Cable engineering | Norms and standards

3.7 Flame-retardant

It describes the fire behaviour of cables tested according to IEC 60331. Flame-retardant is a property of the insulation material to only catch fire after a delay when it is exposed to a naked flame and extinguishes automatically when the flame is removed. Please take care of the valid standards which are mentioned in the datasheet of every cable.

3.8 Silicone-free

If silicones are used, no paint or lacquer can be applied on the outer jacket. Therefore, we generally manufacture our products silicone-free.

3.9 REACH/RoHS II

Restriction of the use of certain hazardous substances in electrical and electronic equipment.

Restricts the use of lead, mercury and cadmium in electronic devices and cables. The materials are hazardous for environment and toxic.

3.10 UL Underwriters Laboratories

This label states that the cables have been tested according to the safety UL standards in Canada (c) and the USA (us). Our certified cables have an AWM-Style number (Appliance Wiring Material; Materials used while manufacturing), which determines information about core, insulation and shield.

3.11 CE Communautés Européennes

The CE marking is affixed on a product and states that the product has been assessed before being placed on the market and that it meets EU safety, health and environmental protection requirements. The manufacturer is permanently liable for this product; the legislator only sets the conditions.

05 Electrical values

5.1 Nominal voltage

The nominal voltage defines the working range of the cable in dependence of a standard. The amount of the acceptable voltage differs in dependence of the approbation.

5.2 Insulation resistance

The used insulation materials have resistance properties to stop the current flow. The insulation resistance is in inverse proportion to the cable length. The insulation resistance is an indication of quality of the insulation material between two cores or a core and the shield.

5.3 Electrical load capacity

These values are extracted from DIN VDE 0298-4. The laying procedure "Continuous flexible/moving in a cable carrier" is not standardized. Due to this fact these values are for orientation only. Please observe reduction factors for cumulation of cables and varying ambient temperatures while selecting cables. Please observe additional standards which will be security-relevant for the application.

All data in this publication are to be used as guidelines for planning purposes only. In particular, we do not guarantee that the products supplied suit the users application. It is the customer's responsibility to verify that our products fit the users application specifications.

5.5 Calculation of the copper surcharge

The copper contained in cables is already calculated into the sales price at \in 150.00/100 kg (copper basis). The current price of copper, the German DEL quotation, rises and falls on a daily basis. The difference between the copper basis and the daily quotation is calculated and added to the cable price (copper surcharge).

The formula for calculating the copper surcharge (€/m):

Copper weight (kg/m) x ((DEL quote (€/100 kg) + 1 % procurement costs)) – copper basis (€/100 kg))
100

DEL quotation

The DEL quotation (Deutsches Elektrolytkupfer für Leitzwecke / German Electrolytic Copper for Conductor Purposes) is a market quotation for copper used in cables with a purity of over 95.5 %.

Copper basis

Is the proportional value of copper already included in the cable price. This is € 150.00/100 kg copper for all **TRAXLINE®** cables.

Copper weight

The copper weight is the weight of the copper in a cable. This can vary greatly depending on the cross-section and the number of cores used, and is specified in kilograms per meter (kg/m).

Example:

 Copper weight:
 0.152 kg/m

 DEL notation:
 300.00 €/100 kg

 Copper base:
 150.00 €/100 kg

Rebates and discounts do not apply to the copper surcharge. The copper surcharge is indicated separately in our invoices..

0.152 kg/m x ((300.00 €/100 kg + 3.00 €/100 kg) − 150.00 €/100 kg)

100

= 0.23 €/m copper surcharge per meter of cable

175

06 Materials

from page 164

6.1 Used plastics

The plastics which are used in our TRAXLINE cables can be divided in the following material groups:

PVC - Polyvinyl chloride

The most used material in cable manufacturing industry used for insulation and outer jacket. By adding different substances to the composition like softener, stabilizer or colors the properties of the material can be changed and influenced as needed. PVC has a very good dielectric insulating properties and a good slippage.

PUR – Polyurethane

PUR has very high notch toughness and a very high chemical resistance and is used for insulation, inner jacket and outer jacket. With the high flexibility, even at cold temperatures and very low water absorption PUR is qualified especially for outdoor applications. In addition PUR has a high resistance to wear of friction.

PP - Polypropylene

Because PP has very high values of breakdown of a dielectric it is a very good material for electric insulation and inner jacket. In combination with a PVC/PUR/TPE outer jacket it is possible to manufacture a cable for very hi-flex applications in cable carrier.

TPE-0 – Thermoplastic Elastomer

Thermoplastc Elastomer based on Olefin. Used for outer jackets of cables for high demanding applications and very long travel-length.

01 Selecting a suitable cable carrier

1.1 Required basic data for determination

The cable carrier is selected based on different factors which have to be considered in combination. The following parameters should therefore be already available when starting to select a cable carrier:

- Installation of cables and hoses
 - (Number and diameters of the installed cables and hoses as well as the cable weight including media (kg/m), required minimum bending radius)
- Dvnamic parameters (Travel speed, acceleration/deceleration, desired motion cycles)
- Motion sequence (For which type of motion is the cable carrier used?)
- Installation situation (How much space is available? Installation width? Installation height?)
- Operating temperature
- Contamination and degree of contamination (Which type of contamination? Which amount?)
- Application-specific ambient influences (e.g. chips, oil, moisture, chemicals)

1.2 Selecting a suitable version

TSUBAKI Kabelschlepp offers a variety of cable carriers for all areas of application. The suitable product can be roughly determined with the available basic data.

Selecting the suitable material: side bands made of steel or plastic?

In addition to the environmental conditions, the selection of the suitable material is determined by the dynamic parameters and the load on the cable carrier. Plastic cable carriers have become established in many areas of application over the years. The application should always be examined in detail beforehand, though. The following table shows the operating parameters as a configuration tool for the suitable cable carrier material:

Operating conditions	Plastic	Steel
Travel speed > 2 m/s	+	-*
Travel cycle > 1 million	+	_*
Continuous temperature		
< - 40° C	-**	+
-40° C to $+100^{\circ}$ C	+	+
> + 100° C	_**	+
Acidic environment	-	+***
Radioactive radiation	-	+***

Operating conditions			Plastic	Steel
Vacuum Extremely rough operating conditions (e.g. heavy industry, mining, drilling)			- •	+*** +
Very high mechanical load			•	+
very suitablesuitablenot suitable	* ** ***	possible as custom version special material available stainless steel version available		

Our technical support can provide help for critical applications: technik@kabelschlepp.de

Selecting the cable protection: open or closed cable carrier?

The selection of the suitable cable carriers can be further limited with the question whether the guided cables require additional protection (e.g. against foreign bodies) and whether a cable carrier with a cover system is practical.

The following table is a simple guideline; the exact choice should be determined after detailed examination of the specific application. In many cases, closed cable carriers are also used to hide the cables for visual reasons.

For very large accumulations of fine contamination (e.g. dust or sand), especially in combination with moisture, we advise against using the cover systems. This affects the function of the overlapping covers substantially.

Cover systems are available for steel and plastic cable carriers.

Operating conditions	Open cable carriers	Covered cable carriers
Coarse contamination (e.g. chips, metal parts, glass splinters)	•	+
Hot chips/metal spatter	-	+*
Visual protection (hiding the cables)	-	+
Very high incidence of fine contamination (e.g. sand, dust, scale)	•/+	-
Very fine contamination and moisture (e.g. moist dust)	•/+	-

- very suitablesuitable
- not suitable
- * Also possible as steel band cover Special materials for covers on plastic cable carriers possible

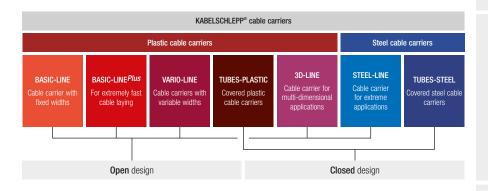

Example: Cover system with chips

Negative example:Cover system with high dust accumulation

According to the specification plastic/steel and open/closed, you can select the suitable cable carriers according to the following diagram in the respective catalog chapter:

Fechnical Information

from page 178

Configuration guidelines | Selecting the cable carrier

1.3 Defining the cable carrier size

The number and diameter of the cables to be installed play a major role here. Very often, the dimensions of the installation space for using a cable carrier are very limited. Both these prerequisites therefore have to be balanced.

The basic data of the cables to be installed are required for the further configuration of the cable carrier:

Type (cable or hose)

■ Cable weight incl. media (q₇)

Outer diameter (d)

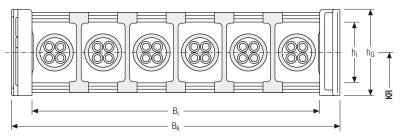

Minimum bending radius (KR_{min})

Please select a cable carrier with a sufficient inner height. Adequate space on the side for placing the cables should also be planned for the initial configuration. They have to be arranged freely in the cross section of the cable carrier. The following minimum values for the required space apply:

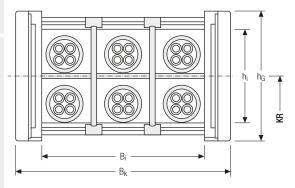

Cables: 1.1 x d (for diameter d < 20 mm, minimum required space: d + 2 mm) **Hoses:** 1.2 x d (for diameter d < 20 mm, minimum required space: d + 4 mm)

More information for installing cables can be found in chapter *Placement guidelines* on page 188.

The first draft for a so-called stay pattern can then look as follows, for example:

It is possible that the cable carrier becomes too wide with regard to the permitted installation dimension. In this case, a larger cable carrier can be used in combination with one of the divider systems. The placement could then look as follows, for example:

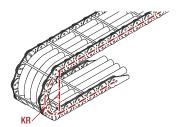

For the installation of cables in the cable carrier, please also take the selected installation variant into account (see page 192) which can have additional implications for loading the cable carrier. The different available stay variants (e.g. hole stay, tube stay) also allow different variations to suit the application.

This initial draft still has to be verified with regard to the further configuration of the cable carrier in the following (e.g. unsupported use).

Determining the bending radius KR

The chapter for the selected cable carrier contains the sizes of the available bending radii. The selection of the bending radii depends on the cables used. The information from the cable manufacturer regarding the dynamically moving minimum bending radius have to be taken into account for this.

The selected bending radius of the cable carrier has to be equal to or greater than the largest minimum bending radius of the cables to be installed.

We recommend using KABELSCHLEPP® cables which were specially designed for use in cable carriers.

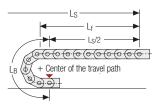

1.4 Determining the cable carrier length $L_{\boldsymbol{k}}$ for simple linear travel

It is practical to place the fixed point connection at the center of the travel path. This provides the shortest connection between fixed and movable driver point and therefore the most economical cable carrier and cable length. Of course your cable carrier can also be installed with a fixed point outside of the center of the travel path. The calculation follows these examples:

For fixed point at the center of travel path L_S , the following applies for cable carrier length L_k :

Cable carrier length L_k $L_k \approx \frac{L_S}{2} + L_B$

Cable carrier length L_k rounded to pitch t

The length of carrier in bend L_B is determined according to the selected cable carrier type:

Туре	Length of carrier in bend $L_{\mbox{\footnotesize B}}$
Plastic cable carriers	$L_B = KR x \pi + 2 x t$
Steel cable carriers	$L_B = KR \times \pi + 4 \times t$
QUANTUM® series	$L_B = KR \times \pi + 12 \times t$
TKR series	$L_B = KR \times \pi + 2 \times t$

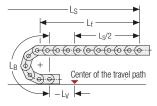

The calculated values can be found in the tables in the respective individual chapters.

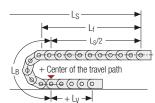

For fixed point outside of the center of travel path L_S , the following applies for cable carrier length L_k :

Cable carrier length L_k

$$L_{k} \approx \frac{L_{S}}{2} + L_{B} + |L_{V}|$$

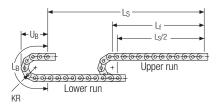

Cable carrier length L_k rounded to pitch t

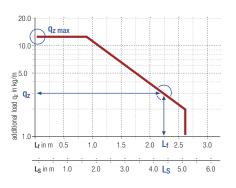

Verification of the load values for unsupported arrangement

The term "unsupported arrangement" describes the condition when the upper run moves parallel to the lower run across the entire horizontal travel length.

The unsupported arrangement is the most common use of cable carriers. The unsupported length Lf resulting from the travel length, and its load on the cable carrier is determined with the cable weight to be guided g₇ from the load diagram.

The load diagram therefore marks the area of the unsupported length L_f in which the cable carrier has no appreciable sagging or, in reverse conclusion, the maximum cable weight at which the cable carrier does not yet sag. If the travel length or the cable weight increases above the value stated in the diagram, the cable carrier starts to sag.

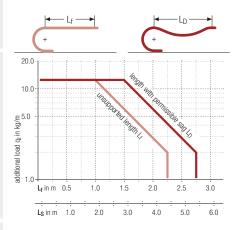

The specific load diagrams can be found in the individual chapters. Please note that the diagrams were determined with a specific intrinsic cable carrier weight. This means that the usable additional load can be reduced for large cable carrier widths or for cover systems.

Furthermore, the upper value q₇ in the diagram indicates the maximum additional load of the cable carrier.

This value must not be exceeded.

The figure on the left shows an example for a load diagram with the most important parameters for determining the respective cable carrier load.

According to definition, the unsupported length Lf is the length at which the upper run of the cable carrier has no appreciable sag.

For steel cable carriers, sagging is not permitted as **a rule.** The higher flexibility of the plastic cable carriers allow a slight increase of the additional load or of the unsupported length. As a rule, we advise against this unsupported arrangement with permitted sag LD for reasons of dynamics and appearance.

Increased wear of the links also has to be expected. It cannot be ruled out, however, that in individual cases a solution may have to be implemented in this way at low travel speeds. In this case, please request the corresponding values from us.

We will be happy to advise you.

Exceeded the load diagram?

There are several options if the unsupported length of the cable carrier is exceeded:

- Selecting a more sturdy cable carrier with a longer unsupported length and higher additional load
- Using a multi-band carrier for increasing the additional load
- Supporting the upper run after the fixed point: depending on the dynamic parameters, this arrangement can practically double the travel length. We are happy to help with configuring a suitable support structure.
- For very long travel lengths, the cable carrier has to be configured as gliding or rolling.

More information on these installation variants can be found from page 192.

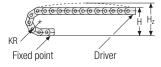

1.5 Connection height, pretension & installation height

Kabelschlepp cable carriers are manufactured with pretension as a standard in order to implement the most extensive unsupported length possible. This produces an elevation of the upper run in the area of the unsupported length and is already considered in the load diagram.

The pretension increases the installation height of the cable carrier to the total value H_z . The connection height H and the installation height H_z are determined for each cable carrier type according to the following guidelines.

Connection height H and installation height H_z for plastic cable carriers

The values for determining the connection height H can be found in the respective individual chapters. They are generally determined as follows:

Installation height $H_{\rm Z}$ is also listed in the respective individual chapters as an allowance for the pretension, specifically for each cable carrier.

Туре	Connection height H
Plastic cable carriers*	$H = 2 KR + h_G$
M1300 series	$H = 2 KR + 1.5 h_G$
TKHD series	$H = 2 KR + 1.5 h_G$
QUANTUM® series	$H = 2 KR + \frac{4}{3} h_G$
TKR0150 series	H = 2 KR + 50 mm
TKR0200 series	H = 2 KR + 82 mm
TKR0260 series	H = 2 KR + 98 mm
TKR0280 series	H = 2 KR + 112 mm

^{*} not for M1300

TSUBAKI KABELSCHLEPP technical support

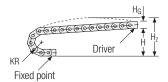

If you have any questions about the configuration of cable carriers or other technical details please contact our technical support at technik@kabelschlepp.de. We will be happy to help you.

Installation height Hz for steel cable carriers

Due to the higher stability of steel cable carriers, the pretension z can already be taken into account on unsupported arrangements by slightly increasing the connection height H. This is based on the following calculation:

Connection height H for systems without support (unsupported)

 $H = 2 KR + 1.5 h_G$

If the unsupported length is increased with support rollers or a continuous support frame, the upper run has to be placed parallel to the support plane.

Connection height H for systems with support

 $H = 2 KR + h_G$

To be sure, another verification of the installation height H_Z should be carried out for steel cable carriers depending on the pretension and cable carrier length. The following rule of thumb applies:

Installation height H₂

 $H_z = H + z$

Pretension $z \approx 10 \text{ mm/m}$ cable carrier length

For example, the installation height H_{Z} for a cable carrier length of $L_{\text{K}}=5000$ mm increases by 50 mm. Depending on the installation variant, it is still necessary to operate the cable carrier without or with reduced pretension. This is possible on almost all types.

1.6 Consideration of stability

In the tension end position, the stability of the cable carrier must be considered. For extensive unsupported lengths, the remaining small support area at the fixed point can reduce the stability for very narrow cable carriers. Accordingly, the ratio between bending radius KR and outer cable carrier width B_k should always be taken into account for dimensioning of the cable carrier.

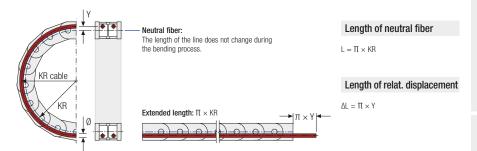

Support area

If the outer cable carrier width on an extensive unsupported length is significantly smaller than the required bending radius, the option of a lateral support should be considered if stability seems at risk. In this case, please contact our technical support.

1.7 Consideration of relative displacement

An arrangement where the cables are placed next to each other and separately should be preferred. This arrangement is recommended to keep the relative displacement of the cables as low as possible.

Configuration guidelines | Selecting the cable carrier

Due to the off-center placement, the cables move in the cable carrier by the value of the relative displacement. This can cause increased cable wear on the stays.

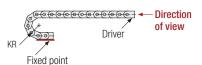

02 Placement guidelines for cables and hoses in cable carriers

Cable carriers are designed to protect moving energy lines and data lines which can be guided together in a variety of combinations. The following chapters list the guidelines which ensure configuration of the cable carrier system for maximum service life.

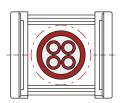

1.1 General guidelines

A "direction of view" is defined to allow a clear definition of the position of the cables in the cable carrier. For KABEL-SCHLEPP cable carriers, the view is always into the driver.

Only cables which are suitable for use in cable carriers should be used, e.g. TRAXLINE® cables.

Cables and hoses have to be able to move freely in the cable carrier. They must not be attached or tied together.

The following guide values apply for dimensioning the required clearance:

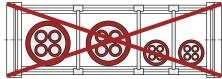

- For round cables:
 - 10 % of the diameter*
- For flat cables: 10 % of the cable width/thickness each
- For hoses:
 20 % of the diameter for pressure hoses**
- * For diameter d < 20 mm, min. space requirement: d + 2 mm

10 % - 20 % for unpressured/low-pressure hoses*

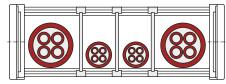

** For diameter d < 20 mm, min. space requirement: d + 4 mm

Weight distribution for installation

For the installation of cables and hoses, please ensure that the cable weight is symmetrically distributed across the width of the cable carrier. Even loading can help the cable carrier to achieve its maximum service life.

Good weight distribution

More Information:

Technical annex | Placement guidelines

No cable loops

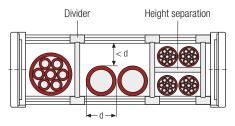

When cutting the cables for installation in the cable carrier, remove the cable from the coil tangentially and not in loops.

Do not twist cables

When cutting the cables for installation in the cable carrier, unwind the cable from the drum without twisting it.

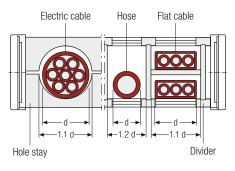

Separating multiple cables

Adjacent cables with strongly differing diameters should be separated by dividers. Directly adjacent placement of cables with strongly differing diameters has to be avoided.

If this is unavoidable, ensure that the remaining clearance height is smaller than the smallest cable diameter. This is the only way to prevent the cables from becoming tangled

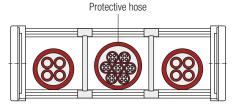

Multiple layers

When placing cables in multiple layers, we recommend installing a height separation between the individual layers for electric cables.

Individually manufactured hole stays or partitions through dividers prevent adjacent cables from rubbing against each other. In many cases, it is beneficial to place each cable in a separate chamber.

A height separation always has to be installed between multiple layers of flat cables.

Collating in protective hoses

Thin hi-flex cables with low bending strength have to be loosely bundled and sorted in a protective hose. The cross section of the protective hose has to be significantly larger than the sum of the individual cable cross sections.

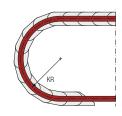

As a guideline for determining the cross section: each cable takes up approx. 10 % of its diameter as a clearance all around.

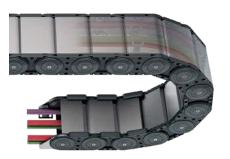

Technical annex | Placement guidelines

It always has to be ensured that the cables can run through the bending radius KR without any tensions or force.

They have to move freely lengthwise and must not exert any towing forces on the cable carrier in the bend.

For multiple layer, the cables have to be placed in such a way that they also have enough clearance between them in the cable carrier bend.

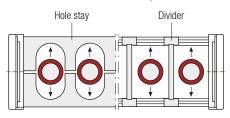

Installing cables and hoses in closed cable carriers

For large numbers of electric cables in covered cable carriers or in energy conduits, the current carrying capacity of the cables has to be configured according to the applicable standards, regulations and recommendations so that the maximum permissible temperatures for the corresponding cable materials and the cable carrier material are not exceeded.

For your configuration, please note that this is a closed system.

1.2 Placement of pressure hoses

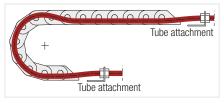

The following applies regardless of the partitioning type of the stay cross section:

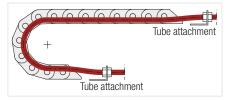

Pressure hoses have to be able to move freely because they expand or contract during pressure changes!

Expansion or contraction can be compensated in the bending radius area. The required clearance can be calculated depending on the proportional change (manufacturer's information).

If technically possible, we recommend placing each pressure hose in a separate chamber.

Pressure hoses are often attached to a tube directly before the driver and fixed point connection. Length differences, which result from the pressure change but also from manufacturing tolerances during installation of the hoses, can result in increased wear in the area of the bending radius.

Hose too long

Hose too short

For your configuration, please take into account a suitable length compensation for the hoses so they can run through the bending radius without tensions or force. It is often sufficient to provide a loop before the fixed point to compensate for the hose length.

Technical annex | Placement guidelines

1.3 Strain relief

The strain relief for the cables depends on cable type, length of the cable carrier and installation variant. Generally, it has to be ensured that the retention force is applied on the largest possible area of the outer jacket so that the cables are not crushed while also preventing displacement of the cables.

- Within the unsupported area of the cable carrier, electric cables should preferably be equipped with a strain relief on the driver and on the fixed point. For short travel lengths and smaller cable diameters, we recommend the use of strain relief combs and cable ties for this application. LineFix clamps can also be used for larger cable carriers which use a C-rail.
- Longer travel lengths, which require gliding operation of the cable carrier, should also be equipped with strain relief on the driver and on the fixed point. Secure strain relief, e.g. with LineFix clamps, has to be provided especially at the driver connection where push and pull forces are present. When using the strain relief at the fixed point of a gliding cable carrier, it primarily has to be ensured that the installed height of the strain relief is significantly smaller than the chain link height h_G in order to prevent a collision. For slow travel speeds, it is often sufficient to provide fixation with a strain relief comb
- For vertically operating cable carriers, the cables also have to be provided with a strain relief on the driver and on the fixed point.

 For hanging cable carriers with very long travel lengths and high cable weights, it can be practical to install a double strain relief arrangement on both sides.
- Pressure hoses which will not be bolted on in direct proximity to the driver or fixed point also have to be provided with a strain relief, in the same way as the cables. Block clamps are to be used for the strain relief of hoses, since the hose cross-section can be compressed when using clamps!

1.3.1 Strain relief for gliding cable carriers

Strain relief on the driver cable carrier end

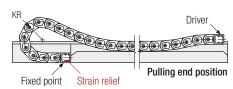

and cable ties on the fixed point of gliding cable carriers.

After moving the cable carrier driver (moving cable carrier end) to the **pushing end position**, the cables are provided with a strain relief at the moving cable carrier end.

Correct cable length in the cable carrier

After moving the cable carrier driver (moving cable carrier end) to the **pulling end position** of the cable carrier, the cables are checked for tension-free length in the bend and, if necessary, "fed further into the cable carrier".

Strain relief on the fixed point cable carrier end

With this tension-free "inserted length", the cables are finally provided with a strain relief at the fixed point cable carrier end.

Test operation of the cable carrier: After an initial test run, check the tension-free cable routing and, if necessary, adjust the strain relief at the fixed point.

INV₁

Horizontal arrangement, unsupported

from page 164 Definition

Technical Information from page 178

For unsupported arrangement, the driver connection of the cable carrier is attached to the movable system part and moves with it in the horizontal direction.

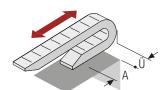

The upper run of the cable carrier is free, i.e. without support and without sag, parallel above the fully supported lower run.

The formulas and configuration information for this installation

variant can be found in the chapter "Determining the cable carrier length Lk for simple linear travel" on page 183.

Special case

Horizontal arrangement, unsupported with overhang

The lower run of the cable carrier is not supported across the entire length. We are happy to calculate the required dimensions $A + \ddot{U}$ for your individual application.

Please contact us for individual project planning for your specific application. We will be happy to help.

Rule of thumb

 $\ddot{U}_{max} \leq \frac{L_f}{4}$

online-engineer.de

TSUBAKI KABELSCHLEPP technical support

If you have any questions about cable carriers or technical details please contact our technical support service at technik@kabelschlepp.de. We will be happy to help you.

INV₂

Horizontal arrangement with support

If the unsupported length of the cable carrier is exceeded, the upper run can be supported.

We recommend using the next larger type instead of a cable carrier with support(s), if the installation situation allows this.

Support for the upper run is generally possible for almost all cable carriers. The support stand used for plastic cable carriers always has to be equipped with start-up bevels. The upper run should be supported as far as possible.

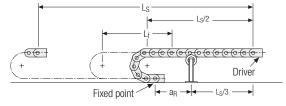

Arrangement of the support

Due to the flexible material and the potential sag, however, there are limitations on the use of supports for plastic cable carriers. The following section therefore examines the arrangement of the support for **steel cable carriers** with support rollers:

Arrangement with one support roller:

$$a_R = \frac{L_S}{6}$$

The distance of the support from the fixed point is approx. 1/6 of the travel length!

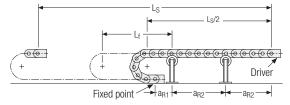

Arrangement with two support rollers:

for
$$L_S < 4 L_f$$

$$a_{R1} = 300 \text{ mm}$$

 $a_{R2} = \frac{L_S}{4} - 150 \text{ mm}$

First support 300 mm behind the fixed point, second support at the center of the remaining unsupported length!

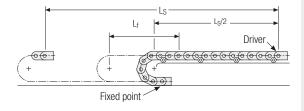

A travel speed of 1 m/s should not be exceeded. When using support rollers, the length L_f should only be 80 % of the value resulting from the load diagram, if possible.

Special version with lateral rollers:

for Ls < 4 Lf

To utilize the maximum possible travel length in an unsupported arrangement with stationary support structure.

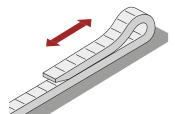

The lateral track rollers are mounted on the chain links. An even running surface has to be ensured, with a support tray provided if necessary.

INV₃

Horizontal arrangement, gliding in the guide channel

from page 164 Definition

The upper run of the cable carrier **glides** on the lower run or on a gliding surface of the associated guide channel.

Application: For long travel lengths which cannot be implemented as unsupported arrangements.

Condition: The cable carrier must be guided in a channel, though!

Fechnical Information

from page 178

Fon: +49 (0)2762 4003-0 Technical support:

online-engineer.de

Different cable carrier types provide the option of using glide shoes on the inner radius. These are manufactured from a special sliding and wear-resistant plastic. This allows the sliding friction factor to be reduced to a value of μ < 0.2.

For steel cable carriers, the use of these elements is mandatory to prevent gliding of "steel on steel". The travel speed, however, should not exceed 1 m/s for gliding steel cable carriers. For steel cable carriers, the glide shoes are bolted onto the side band.

For plastic cable carriers, the glide shoes are simply clipped on the inner radius and can therefore easily be replaced if necessary.

To reduce wear and increase the service life, we recommend using the abrasion resistant glide shoes for gliding applications. For travel speeds > 2.5 m/s, however, glide shoes should always be used.

Arrangement of the cable carrier

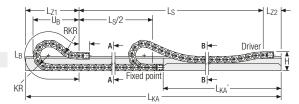

Single-sided arrangement with lowered driver connection and reverse bending radius (standard)

The cable carrier length is always calculated with the same formula as for the unsupported arrangement:

Cable carrier length Lk

$$L_{k} \approx \frac{L_{S}}{2} + L_{B}$$

Cable carrier length Lk rounded to pitch t

For the standard arrangement of the cable carrier, the driver connection is reduced for load reasons:

Connection height H

 $H = 3 h_G$

The length of carrier in bend L_B is increased by the lower driver connection and the resulting cable carrier extension. To keep this elevation of the length of carrier in bend as small as possible, chain links with reverse bending radius (RKR) are used on the driver connection as a standard. This results in a slight S-shape for the bend in the thrust end position. The respective values for L_B can be found in the respective individual chapters for the cable carriers.

For the configuration of this installation variant we recommend the simple way of determining the cable carrier length using our Configurator at **online-engineer.de** or requesting support from our support team.

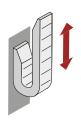

Opposite arrangement with lowered driver connection and reverse bending radius

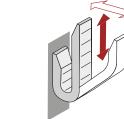

If the cable carrier is wider than the available space due to a very large number of cables, a second cable carrier can be used, running in the opposite direction. This almost halves the total width because the cables can be distributed among both cable carriers.

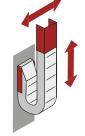

The cable carrier length is then determined in the same way as for single-sided arrangements. For only one moving consuming unit and a joint travel path, both cable carrier lengths have to be the same. As both cable carriers run in a guide channel, it must be ensured that they have the same outer width. More information and the details for dimensioning the guide channel can be found in chapter *Support trays and guide channels* of our catalog *THE COMPLETE KABELSCHLEPP*.

INV 4 Vertical arrangement, hanging

Direction of movement: only vertical

For a purely vertical movement process, the cable carrier can be mounted without special lateral support.

For a combined vertical/horizontal movement process, the cable carrier can be mounted without special lateral support.

If the entire system moves at a right angle to and/or alongside the hanging cable carrier, an additional lateral guide has to be mounted.

Please observe the guidelines for placement of cables in cable carriers from TSUBAKI KABELSCHLEPP, s. page 188.

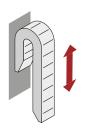

It is practical to install the cable carrier without or with only little pretension.

As no direct load occurs in the hanging arrangement, pretension causes the cable carrier to bulge outwards from the pretension. In addition to the visual aspect, this significantly increases the installation dimensions.

The cables have to be fixed to the driver and fixed point in such a way that their weight and the resulting dynamic load are absorbed only be the strain relief. Determining the cable carrier length see page 183.

INV 5

Vertical arrangement, standing

The cable carrier is mounted in such a way that parallel running of active run and passive run is ensured.

Determining the cable carrier length see page 183.

Technical Information from page 178

Fon: +49 (0)2762 4003-0

Technical support:

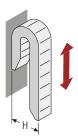

End connectors

The end connectors have to be mounted on the machine part (fixed point/driver) in such a way that the cable carrier cannot bend outwards, i.e. the connection must be rigid.

 $H = 2 KR + h_G$

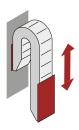

Support

The cable carrier generally has to be supported on the outside at the fixed point and at the driver.

The length of the support has to be defined depending on the additional load, the fill level, the travel length and the selected cable carrier.

Depending on the version of the support, the cable carriers are very often used with a slight pretension. If a short cable carrier does not require any support and if there is sufficient installation space, the standard pretension can be used. Use without pretension may result in the cable carrier bending. This is therefore not advisable.

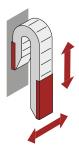

Direction of movement

Often, the complete unit additionally moves at a right angle to the vertical standing cable carrier. In this case, the cable carrier additionally has to be guided laterally.

As a rule, only relatively short travel lengths can be implemented with the standing arrangement. If possible, the cable carrier should alternatively be used in a hanging arrangement. For this installation variant, the load on the overall system is significantly lower than with a standing arrangement.

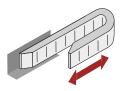

More Information:

Technical annex | Installation variantens

INV 6

Horizontal arrangement, rotated 90° (straight)

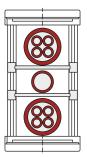

Application: Generally, cable carriers "rotated 90°" are used when the installation situation is primarily short on space with respect to height, preventing normal horizontal installation.

The installed cables have to be guided in the cross section of the cable carrier with fixed separating elements or in a hole **stay**, clearly separated from each other. This is the only way to prevent damage in the long run.

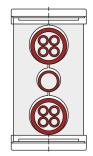

The technically best solution is the hole stay which provides the most secure guiding for the cables.

Frame stay with movable dividers

Frame stay with fixed dividers

Best possible separation of cables in a hole stay

Systems for short travel lengths (with/without support)

The cable carriers can be used **unsupported** in the horizontal arrangement "rotated 90°" to a limited extent. The permitted unsupported length depends on the following parameters for this installation variant as well:

additional load q₇

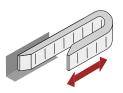

■ bending radius KR

connection option

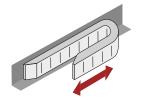

■ travel length L_S

■ cable carrier width B_k

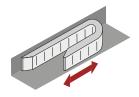

If the additional load and the unsupported length are too great, the cable carrier has to be supported on one side or

System without support

System with single-sided support

System with overall support

System for long travel lengths (gliding in a guide channel)

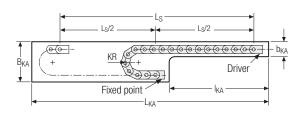

Plastic cable carriers can be used for travel lengths far over 100 m with the arrangement "rotated 90° - straight".

Over a period of more than 60 years, we have built multiple systems with the arrangement "single-sided" or "opposite" with or without special auxiliary fixtures.

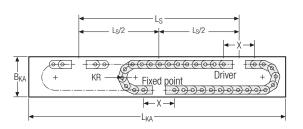

Single-sided arrangement

(with stepped guide channel)

b_{KA} = channel width of narrow section IKA = length of narrowed channel

Opposite arrangement

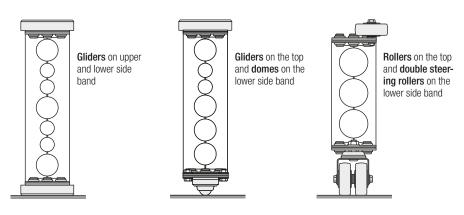

The cable carrier "rotated 90°" for long travel lengths must be guided in a channel. The material and texture of the channel base must be selected so they ensure low-wear travel with the lowest possible friction forces.

For long travel lengths, the cable carriers are used without pretension.

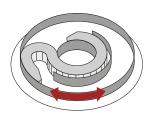

For steel cable carriers, corresponding gliding and guiding elements are mounted on the outside and/or inside of the side band, preventing grinding along the channel walls and ensuring smooth running of the system.

Support and guiding elements (combination examples):

INV₇

Horizontal arrangement, rotated 90° (circular)

ıη̈́.

For this arrangement, the cable carrier rotated 90° is connected to machine parts which carry out a circular movement.

The combination of bending radius KR and reverse bending radius RKR causes the cable carrier to move in two circular directions in a targeted and defined manner.

The cable carrier system is connected to the inner and outer rings of a guide channel. The rotating ring (inside or outside) is the driver connection.

Application: Generally, cable carriers in this arrangement always have to be guided in a channel. The driver can be positioned inside or outside.

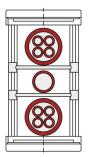

A special chain link design is required to allow the cable carrier to execute a circular movement.

The installed cables have to be guided in the cross section of the cable carrier with fixed separating elements or in a hole stay, clearly separated from each other. This is the only way to prevent damage in the long run.

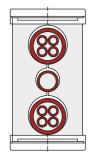

The technically best solution is the hole stay which provides the most secure guiding for the cables.

Frame stay with movable dividers

Frame stay with fixed dividers

Best possible separation of cables in a hole stay

Due to the strong relative displacement and the continuously changing radius ratios, cables should only be installed in one layer to ensure maximum service life.

For **steel cable carriers**, corresponding gliding and guiding elements are mounted on the outside and/or inside of the side band, preventing grinding along the channel walls and ensuring smooth running of the system see page 200).

TSUBAKI KABELSCHLEPP technical support

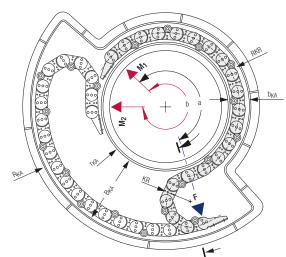

If you have any questions about cable carriers or technical details please contact our technical support service at technik@kabelschlepp.de. We will be happy to help you.

Single-sided arrangement

with offset guide channel (schematic diagram)

The cable carrier system shown here has the driver on the inner radius. There are also frequent applications where the driver has to be positioned on the outer radius.

To ensure sufficient guiding of the cable carrier in this case, moving guide plates are required for larger angles of rotation. As this version is more complex, the "inside rotating circular arrangement" should be preferred.

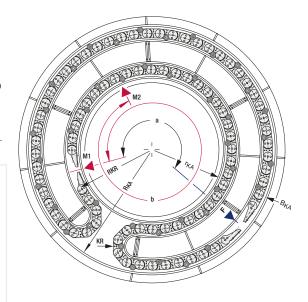

Opposite arrangement with guide carriage (schematic diagram)

For opposite arrangements, a moving support fixture or a guide carriage has to be positioned in the channel due to the combination of KR and RKR.

Coupling of multiple circular systems is possible for angles of rotation over 500°.

Abbreviated symbols:

- = fixed point angle
- β = travel length
- B_E = width of cable carrier
- b_{KA} = channel width of narrow section
- B_{KA} = channel width
- H_E = height of cable carrier
- H_{KA} = height of the guide channel
- r_{KA} = channel radius inside R_{KA} = channel radius – outside
- F = fixed point
- M 1 = driver end position 1
- M 2 = driver end position 2

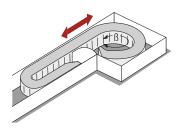

Due to the variety of configuration options for this installation variant, we recommend contacting our technical support. We require the following parameters for preparing a solution:

- inner diameter
- outer diameter
- travel length (angle of rotation)
- single-sided or opposite arrangement?
- driver on inner or outer radius? (inner radius preferred for single-sided arrangement)
- restrictions for the installation space? (e.g. installation height)
- cable list
- environmental conditions (e.g. chips, dirt)

INV₈

Horizontal arrangement, rotated 90° (rolled)

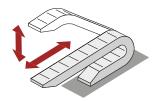

For this arrangement, the cable carrier rotated 90° is connected to a consuming unit which carries out a circular movement. The travel length " β " is indicated in degrees!

Application: The application is designed for circular movements which are wound on a rotating body. This type of cable carrier is preferred for smaller systems, usually with large movement angles.

A standard cable carrier is used. A reverse bending radius is not required. The winding of the carrier limits the angle of rotation to approx. $\beta = 270^{\circ}$. For the implementation of larger angles of rotation, additional guide plates are required to prevent a collision on the driver. This application is practically a combination of installation variants 6 and 7. Accordingly, similar configuration criteria are used.

INV9

Horizontal-vertical combined arrangement

Our cable carriers can also be used for combined horizontal/vertical movements.

This arrangement requires no special technical preconditions, but calculation of the cable carrier length is more complex and should be carried out by our technical support.

INV 10

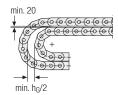

Unsupported arrangement, nested

This arrangement is possible for all cable carriers. If the available space do not permit installation of a cable carrier due to the required width, the system can be configured in a **nested** arrangement.

For smooth running, it has to be ensured that both cable carriers can move freely. This means sufficient distance between the upper run (min. 20 mm, depending on cable carrier type) and the carrier bends (min. half of chain link height).

For long steel cable carriers there is an option for positioning guide plates at the side band of the outer carrier to ensure alignment of the inner carrier.

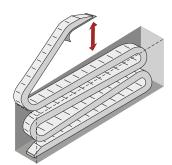

from page 164

Definition

Technical annex | Installation variantens

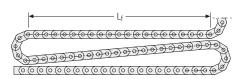

INV 11

Zig-zag arrangement

As several bends fold on top of one another, the cable carrier has to be guided in all directions and therefore settles into a type of basket or sheet steel housing.

The following parameters are required for dimensioning the system:

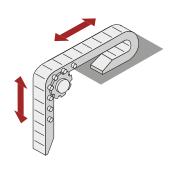

- travel length
- travel speed
- cables installed

- minimum bending radius of guided cables
- maximum permitted height
- maximum permitted basket dimensions (length, width)

When dimensioning the basket length, ensure that the unsupported length Lf of the selected cable carrier is not exceeded. Depending on the length and weight of the cable carrier, supporting the bend on the driver with a bent plate is a measure which has a positive effect on the service life.

INV 12

Vertical arrangement, hanging with support bolt

The vertical arrangement of the cable carrier with additional support elements offers the option of using the cable carrier as a lifting element for the attached system parts (e.g. operating panels, manipulators).

The cable carrier is driven via chain wheels. The pitch circle diameter has to be equal to or greater than the selected bending radius of the cable carrier. The drive is motorized or via a counterweight.

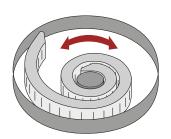

Due to the great number of configuration aspects, we would ask you to contact our technical support.

More Information:

Technical annex | Installation variantens

INV 13

Horizontal arrangement, curled

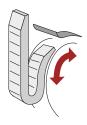

A standard cable carrier can be used, but a relatively large installation space is required for curling up the configuration.

The rotation in this application is limited by a maximum double wrapping of the inner diameter. Multiple wrappings cause the cable carrier to jam.

INV 14

Vertically rotating arrangement, hanging

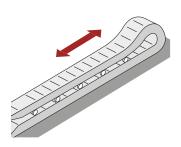

This installation variant is often used for swiveled drums and turning devices.

The part rotating around the diameter requires chain links with KR and RKR in this area.

If the angle of rotation is over 180° (depending on the arrangement), an additional guide plate is required on the outer radius to prevent the cable carrier from tipping over.

INV 15 Roller chain

Roller chains are primarily used where very long travel lengths lead to very high push and pull forces and gliding cable carriers reach their limits. The most effective installation variant is the RSC (rail supported carrier) system. This is a cable carrier where the design in combination with an optimized guide channel ensures 100 % roller operation over the entire travel length. This results in minimum mechanical load and a low noise level.

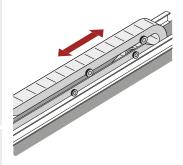

This makes the system suitable not only for extremely long travel lengths, but also for travel speeds over 5 m/s.

Despite the roller design, the RSC system can be fully wound on a reel and is therefore ideal for complete solutions with inserted cables for long travel lengths.

Dimensioning is similarly easy as for a gliding cable carrier. For effective and fast implementation, especially for large projects, we can offer our expert help.

INV 16

Arrangement with continuous support structure

While this installation variant is also possible for plastic cable carriers, it is primarily used for steel cable carriers.

If the technical conditions no longer permit the use of a gliding cable carrier or a cable carrier with support rollers with regard to travel length, acceleration or speed, a so-called cable carrier unit with a continuous moving support structure can be used.

Cable carrier units are particularly suitable for use with large travel lengths and high travel speeds under rough operating conditions and heavy loads. There is a variety of different versions of this installation variant. As an example, we present the most used type 225 here.

Due to the complexity, this type of cable carrier system should be dimensioned in cooperation with our engineers.

Cable carrier installation type 225

The cable carrier installation is either configured as a single-sided system with one cable carrier installation or as an opposite arrangement with two

A carriage guided on rollers in a running frame supports the cable carriers along their entire length. The support structure is moved in both directions with a cable pull system which is attached to the rolling carriage system. Due to the roller support and roller guiding of the cable carriers

on the support carriage and of the support carriage on the running frame, only minimal friction forces are generated in the system. Systems with the following limit values have been supplied so far:

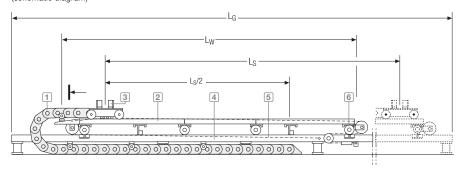

longest travel length: $L_{S max.} = 222 \text{ m}$

highest travel speed: = 4 m/s

greatest travel acceleration: $= 8 \text{ m/s}^2$ a_{max}

Single-sided arrangement

(schematic diagram)

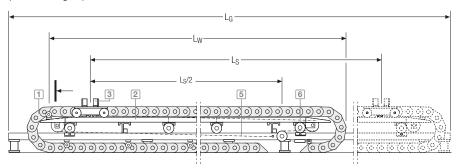

More Information:

Technical annex | Installation variantens

Opposite arrangement

(schematic diagram)

Cross section of the cable carrier installation

Abbreviated symbols:

 B_D = clear width in the running frame

B_G = running frame width

B_k = cable carrier width

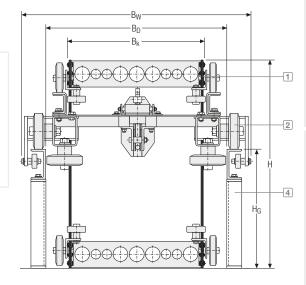

B_W = support carriage width (max. width)

H = installation height of the cable carrier(s) H_G = running frame height

L_G = running frame length

L_S = travel length

L_W = support carriage length

The cable carrier installation type 225 consists of the following assemblies:

- 1 Cable carrier(s)
 - with laterally attached track rollers and guide rollers
- 2 Support carriage with track rollers and guide rollers supporting across the entire length
- 3 Rolling carriage system with track rollers and guide rollers
- 4 Running frame
- 5 Steel cable
- 6 Cable tensioning roller
- Tensioning device

Strain relief devices

For optimum placement with dynamic use of cables

Strain relief devices | Overview

Strain relief devices

KABELSCHLEPP® strain reliefs were developed especially for use in cable carriers. We offer the best solution for each of many different areas of application. The type of

strain relief to be selected depends on cable type, length of the cable carrier and installation position.

LineFix® clamps......page 210

- Optimized foot geometry for secure seating in the C-rail.
- For one cable and two or three cables stacked.
- For C-rails with 11 mm slot width.

Strain relief combs page 214

- Higher fixing force than single-sided strain relief comb.
- Uniform force transmission in push and pull direction.

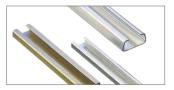

SZL strain reliefs page 216

- Gentle on the cables through large contact area with the cables.
- Simple mounting without tools.

Block clamps page 217

For strain relief of hoses.

Assembly profiles page 218

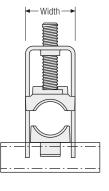

■ Assembly profiles for strain relief elements

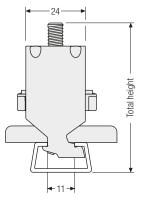

LineFix clamps | Overview

- For C-rails with 11 mm slot width.
- For one, two or three cables stacked.
- Optimized foot geometry for secure seating in the C-profile.
- High grade corrosion protection of the coated housing body through cathodic dip coating (CDC).
- Pan design with support ribs for secure fixing of the cables.
- Rounded design of the pan elements, gentle on the cables.
 - Also available in stainless steel (ER 1S).

Fechnical Information from page 178

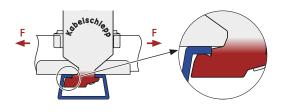

Secure seating and easy assembly

In practical operation, tensile forces occur in both cable directions. Clamps therefore have to transmit high tensile forces in the respective direction.

In contrast to standard commercial clamps, the LineFix® foot geometry ensures transmission of extremely high tensile forces equally in both directions. The catch fixes the foot securely in the C-profile when it is bolted on, preventing the crossbar from tipping out during load application, regardless of the direction of forces or installation.

The data for the total height are guide values. The actual height depends on the cable diameter and the cable structure, among other things.

Pan design with optimized geometry.

The curved support ribs fix the cables very gently and reliably.

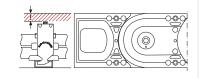

Easy installation even in tight packaging spaces through headless screw with hexagon socket.

Observe minimum height

For cable carriers with upper run gliding on the lower run, the system height of the strain relief must not be higher than the chain link height!

Strain relief combs | Technical data

For separate strain relief or fastening of cables outside of the cable carrier – suitable for all cable carriers.

The strain relief combs are equipped with teeth on both sides. This allows secure fixing of each cable with two cable ties.

- Secure fixing with two or four cable ties
- Higher fixing force than single-sided strain relief combs
- Uniform force transmission in push and pull direction
- Minimized movement of cables and hoses
